

The project involves creating a web application for organizing and planning personal tasks and projects. Users will be able to create accounts, add tasks with descriptions, deadlines, and priorities, and organize them into projects or categories. Each task will have the option to mark it as completed, edit details, or delete it.

The application interface should be intuitive and adaptive for both desktop and mobile devices. The main sections include a task list, a calendar for viewing deadlines, a project management page, and forms for creating and editing tasks. For user convenience, tasks can be sorted and filtered by priority, date, or project.

The system should include user authentication and a database to store accounts, tasks, and projects. Additionally, features such as deadline reminders, calendar integration, and simple statistics on completed tasks can be included to track productivity.

The project is focused on creating a basic, reliable task planner with the possibility of future expansion, such as team collaboration or integration with other services.
